

High voltage, current sense amplifier with open drain comparator and ref

MinISO8

SO8

Features

- Wide common mode voltage: -16 to 80 V
- 2.7 to 18 V supply voltage
- Amplification gain: 20 V/V
- 0.6 V internal reference
- Internal open-drain comparator
- Latching capability on comparator
- High accuracy: 3.5 % max. error overtemperature
- Bandwidth: 1 MHz
- Quiescent current: 1.8 mA maximum
- SO8 and MiniSO8 package

Applications

Maturity status link

TSC200

- High-side current sensing
- Low-side current sensing
- Overcurrent protection
- Telecom equipment
- Test and measurement equipment
- Industrial process control

Description

The **TSC200** is a high-side current sense amplifier which delivers an analog voltage output. It can sense current via a shunt resistor over a wide range of common mode voltages, from -16 to +80 V, whatever the supply voltage is. It is available with an amplification gain of 20 V/V.

The **TSC200** integrates an open-drain comparator with output latch function and an internal 0.6 V voltage reference connected to its input. External resistor divider can then set the switching threshold.

This device fully operates over the broad supply voltage range of 2.7 to 18 V and over the industrial temperature range of -40 to +125 °C.

1. RTI stands for "Related to input".
2. Offset is extrapolated from measurements of the output at V_{Sense} of 20 mV and 100 mV.
3. Total output error considers effects of gain error and V_{OS} inaccuracy.
4. The TSC200 is designed to power up with the comparator in a defined reset state as long as RESET is open or grounded. The comparator is in reset as long as the power supply is below the voltage shown here. The comparator assumes a state based on the comparator input above this supply voltage. If RESET is high at power-up, the comparator output comes up high and requires a reset to assume a low state, if appropriate.

1. See [Figure 3](#) for details, $Hysteresis = V_{TRIP-} - V_{TRIP+}$.
2. Specified by design.
3. V_{ID} is the differential voltage present at the comparator inputs.
4. Open-drain output can be pulled up to 2.7~18 V range, regardless of V_{CC} .
5. The comparator response time specified is the time interval between the input step and the instant when the output crosses 1.4 V.
6. The RESET input has an internal 2 MΩ (typical) pull-down. In case RESET pin is left open, the output shows a LOW state, with transparent comparator operation.
